As the humanitarian situation continues to deteriorate following the earthquake that struck northwest Syria on February 6, the United Nations has identified 555 suspected cholera cases and 20 deaths, with more than 37,700 people having sought medical treatment since the earthquake. The crisis has also led to a severe disruption of key services, with the community or sub-district levels reporting electricity services were not accessible to anyone, or were severely disrupted, in 28% of communities, and water services in 15%.

The rapid needs assessment situation overview shows the immediate needs of affected populations. REACH developed a dashboard which enables you to filter through our information products and visualise the results at the community or sub-district levels. The results are broken down into priority needs of affected populations. REACH also facilitates the development of information tools and products that enhance the transparency of aid to make evidence-based decisions in emergency, recovery and development contexts. REACH activities are coordinated through inter-agency and country-level mechanisms. REACH is a joint initiative of the UN Office for the Coordination of Humanitarian Affairs (OCHA) and ACTED.
